Filler paragraph to push the flag near a page boundary.

FIGURE FLAG F3.3 — Fixation functions

Purpose. Show the three fixation functions together so the reader sees $I_{\text{fix}} = I - D$ as a difference of two curves. *Type.* Python analytic plot. *Exact content.* Three curves $I(t)$, $D(t)$, $I_{\text{fix}}(t)$ evaluated from the closed forms of §6 at $(\lambda, \mu, \delta) = (1, 0.2, 0.05)$ on $t \in [0, 15]$, with $w = \mathrm{e}^{\theta t}$, $\theta = \lambda(a - b)$; horizontal dashed asymptotes at b, b and 0; an annotation marking the initial slope $I'_{\text{fix}}(0) = -(\mu + \delta)$. *Axes and labels.* x: t, range $[0, 15]$; y: probability, range $[0, 1]$; legend entries $I(t)$, $D(t)$, $I_{\text{fix}}(t)$. *Style.* Default matplotlib, `tab:` colours, grid alpha 0.25, `tight_layout`, PDF output, fonts matching the chapter. *Data source.* Analytic formulas of §6; no simulation required. *Placement.* Section *Analytical quantities*, in a `figure` environment with `[ht]`.
