
Initial data are carried forward along characteristic curves
The $z = 1$ boundary records the rupture convention
t
solution domain in the (z, t) plane
$\mathcal{C}_s$
$G(z,t) \xleftarrow{\mathcal{C}_s} G(s,0)$
$z = 1$ boundary
0
s_1
s_2
s_3
s_4
s_5
1
z
Initial curve: one founder
$t = 0$
$z(s,0) = s, \qquad G(s,0) = s$
Catastrophe into H
$G(1,t) = I(t) \le 1$
defective mass after rupture
Killing into state 0
$G(1,t) = 1$
proper probability generating function
Shared characteristic geometry
$q(z) = \lambda z^2 - (\lambda + \mu + \delta)z + \mu$
$\frac{\mathrm{d}t}{\mathrm{d}\tau} = -1, \qquad \frac{\mathrm{d}z}{\mathrm{d}\tau} = q(z)$
same (z, t) curves for both conventions
