

### Model key

$\lambda_1, \lambda_2$ : intracellular replication     $\mu_1, \mu_2$ : ordinary bacterial killing or loss  
 $\nu$ : one-way physiological adaptation     $\delta_1, \delta_2$ : per-capita association with containment failure

Type 2 is a coarse-grained adapted state;  $\delta_i$  are effective associations, not a resolved release mechanism.
