

How far CLASSICAL (matched) drifts from the NEW model
Larger values = classical constant-p ODEs fail to track renewal dynamics

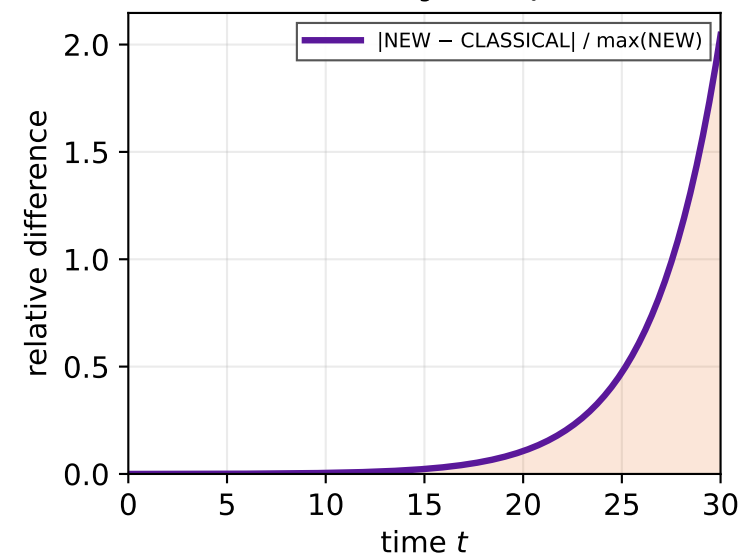

(a) supercritical, $\mu = 0$ ($R_0 = 1.76$)

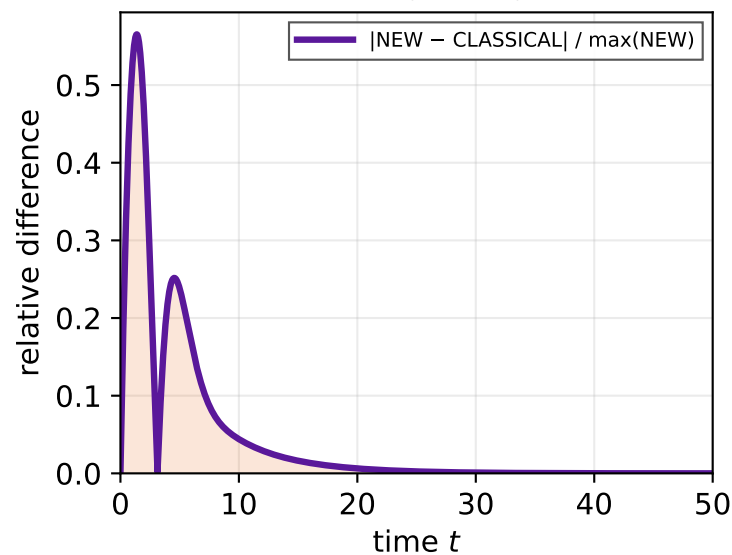

(b) supercritical, $\mu > 0$ ($R_0 = 2.10$)

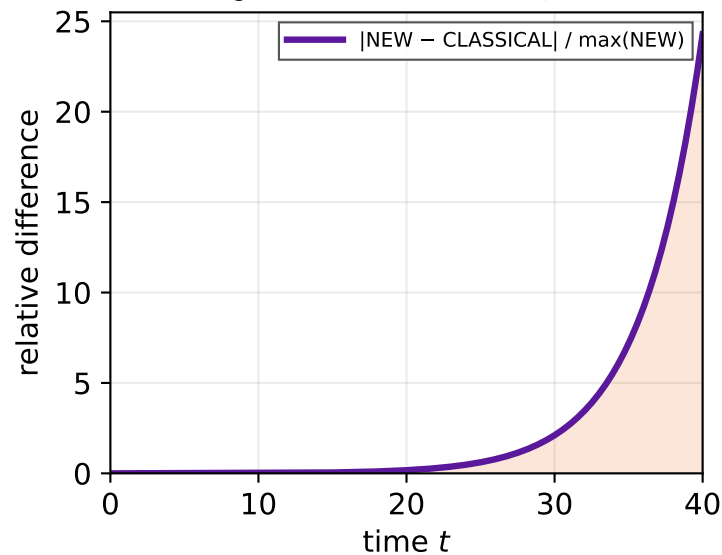

(c) fast burst (large δ) ($R_0 = 2.50$)

(d) subcritical $R_0 < 1$ ($R_0 = 0.27$)

(e) high intracellular death ($R_0 = 2.63$)

(f) free-virion seed only ($I_0 = 0$) ($R_0 = 2.75$)
