

The same intracellular kernels change character across the flooding boundary

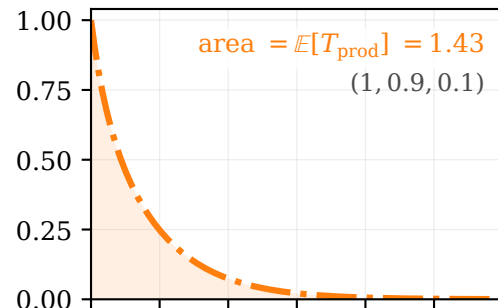

**(a) $L > 1$: no internal death
long-lived survival**

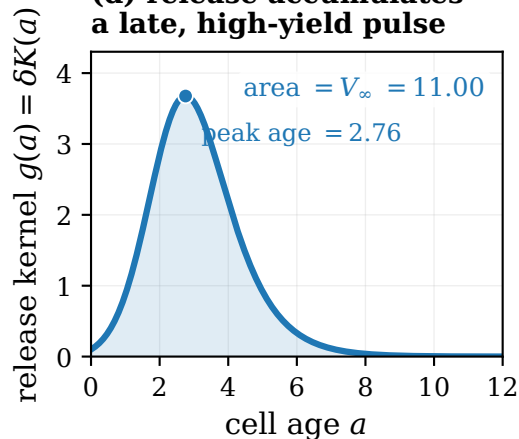

**(b) $L = 1$: boundary regime
rapid survival loss**

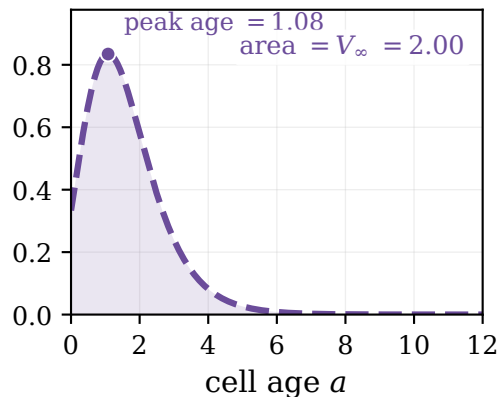

**(c) $L < 1$: internal loss
a longer survival tail**

**(d) release accumulates
a late, high-yield pulse**

**(e) release arrives earlier
a moderate pulse**

**(f) loss spreads release
a broad, low-yield pulse**
