

λ_i births
intracellular replication
of that phenotype

μ_i deaths
ordinary bacterial killing
or non-replicative loss

ν conversion
one-way physiological
adaptation

δ_i catastrophe channels
per-capita association
with containment failure

Coarse-grained states, not molecular claims. Equal arrow weights: no ordering of δ_1 and δ_2 is assumed ($\delta_1, \delta_2 \geq 0$).

The type-2 surface cue is schematic; no release mechanism is depicted.
